

Uranium thread: the original Problem Book

Document ID: SH-PS-JO-001 | **Version:** 1.0.0

Event/effective date: 2024-10-11 | **Available to case company:** 2024-10-11

Created at: 2026-09-05T22:16:52-07:00 | **Publication cutoff:** 2026-09-05T23:59:59-07:00

Fictional author: Evan Vilander, J2 Judgment Officer

Record origin: SYNTHETIC_COMPANY_ANALYSIS | **Evidence state:** SYNTHETIC_RECONSTRUCTED

Decision state: LOCKED_CANON origin; LOCKED_DERIVED_IMPLEMENTATION evidence sequence

Commission and bounded curiosity

The September 11, 2023 commission asked why delivery confidence in a resource-customer dependency review was higher than the evidence supporting its downstream processing assumptions. Uranium was one dependency in that work. The commission did not ask J2 to build a uranium company.

On October 2, Vilander opened one bounded curiosity problem: **Where does reliable access to the next fuel-chain step matter more than nominal ownership of uranium?** Other assigned problems retained their owners. The curiosity allowance did not become permission for an unbounded acquisition program.

Dated working record

Entry / availability	Material received and initial interpretation	What remained unknown / next action
JO-U-01 / 2023-09-11	A customer's planning workbook treated uranium supply and conversion as independently available purchases	The workbook did not show a binding conversion slot; obtain contract definition and planner read-back
JO-U-02 / 2023-09-26	A commercial interview described "available pounds," while delivery terms referred to a licensed conversion receiving point	Determine who carried title, assay/moisture adjustments and qualification risk at each step
JO-U-03 / 2023-10-02	Three transaction summaries used different meanings of "supply secured"	Build a shared chain of physical transformation, contractual right and capacity timing; preserve each original definition
JO-U-04 / 2023-10-20	Technical interviews separated mining competence from conversion, enrichment and fabrication capability	Do not assume an acquired site includes an operating team or a qualified customer position
JO-U-05 / 2024-02-16	Cedar Junction's low asset price hid restart, environmental and requalification exposure	Close the opportunity without closing the strategic question
JO-U-06 / 2024-06-14	Juniper Mesa's resource evidence survived better than its water/access/processing timetable	Keep geological and commercial confidence on different axes
JO-U-07 / 2024-10-04	Salt Rim's "industry consensus" largely traced to one expert's network	Test independent origin of apparently corroborating claims; retain dissent before

Entry / availability	Material received and initial interpretation	What remained unknown / next action
JO-U-08 / 2024-10-11	Mari's Red Wash kill-study offered operating evidence and falsifiable limits	escalation Commission a smaller investable case; do not infer mineability from clean information

Each item is a synthetic reconstruction, not a rediscovered original email or interview recording. Interviewees are described by role where their identities add no useful case content. No fictional customer is represented as a real fuel-cycle company.

Belief revisions

In October 2023 Vilander thought a cheap downstream asset might give Sable Harbor control of a bottleneck. By February 2024 he had learned that the capability, qualified customer relationship and liability boundary mattered more than the deed. By June he had stopped using a low acquisition price as evidence of low capital at risk. By October he had accepted that an expert's reputation could not substitute for claim-level verification.

The surviving thesis was narrower: a nuclear-materials platform could join operating knowledge, commercial rights and downstream intelligence while keeping each activity inside its licensed and technical competence. A credible first mine might teach the institution more than a nominally strategic asset it could not operate. This remained a human judgment, with serious unresolved downside.

What did not fit

Historic pounds did not explain future cash. A permit list did not show a usable operating window. A consistent database could reproduce the same incorrect interpretation perfectly. A specialist could know the industry well and still be wrong about the proposed asset. These anomalies stayed in the Problem Book instead of being tidied out of the investment paper.

The October 11 recommendation was to develop Pale Sun and continue a bounded Red Wash case with Mari's hostile review and Martin Shaw's independent transaction discipline. It was not authority to buy a mine. Daniel and the enterprise's existing capital/governance process would decide whether to fund a company or acquire an asset.

Sources: [Cedar Junction](#), [Juniper Mesa](#), [Salt Rim](#), [escalation history](#). Each later judgment links its earlier belief instead of rewriting what Vilander originally expected.
