

REPOSITORY DELIVERY AND PACKAGING POLICY

Document ID: SH-GOV-DELIVERY-001

Version: 1.0.0

Decision date: September 6, 2026

State: LOCKED on acceptance into controlling repository canon

Owner: Repository owner

Stewardship: Repository maintainers

Authority: [CLOSE-004](#)

Structured companion: [Repository delivery and packaging policy](#)

1. Completion and canonical acceptance

Nothing is delivered or closed merely because it exists in a conversation, attachment, local scratch directory, or completion statement. A checksum without retrievable artifact bytes is not delivery. An approved decision must be recorded, reconciled, and accepted into the repository's controlling canon before it becomes the source of truth. A pending branch or PR is a preserved proposal or implementation checkpoint and must be described as pending.

Conversation approval is originating authority and provenance for a change. Preserve its substance in a dated repository decision record; the reader must not need access to the conversation to determine current canon. Once accepted, that record and its stated supersession scope control. A commit alone does not create approval, and an approved draft alone does not establish completed repository integration.

Closeout evidence identifies the accepted commit or PR, controlling records, delivered artifact paths or release URLs, applicable validation results, and any remaining limits. Closing a decision issue does not claim that separately deferred implementation has been delivered. This repository policy records the owner's approval; it does not invent an in-universe Board meeting, consent, or ratification.

2. Repository-wide artifact disposition

Material	Location and treatment
Canonical documents, code, schemas, configuration, generators	Versioned in Git. Preserve source identifiers, status, and lineage.
Approved source artwork and canonical visual references	Versioned in Git with provenance and rights information. An approved source-artwork exception, including the controlling J2 PNGs, remains explicit.
Controlled corporate PDFs and publications	Versioned in Git alongside their source lineage. Regenerate from accepted source; reconcile versions, manifests, and hashes. A publication does not independently create canon.
Complete distributable ZIP packages and other packaged bundles	New versions belong in indexed GitHub Releases, with version identifiers, manifests, and SHA-256 checksums. Do not add duplicate current package bytes to the Git tree by default.
Convenience renders and previews	Temporary by default. Retain a useful review or evidence render deliberately, with its purpose and source identified; it acquires no independent authority.
Temporary previews, intermediate	Exclude from Git unless deliberately retained as evidence. Local generation is a

Material	Location and treatment
renders, caches, build debris	working step, not delivery.
Generated institutional JSON/SQLite catalogs	Keep their current in-tree placement and existing regeneration rules while issue #37 remains OPEN. This policy does not decide their complete lifecycle.

The narrow historical ZIP exceptions in section 4 justify retaining the existing bytes in-tree. They do not make the default for new distributable versions ambiguous. Controlled individual publications remain in-tree even when a release bundle also includes them.

3. Release identity, discovery, and corrections

Every controlled release package must be discoverable from the repository's [controlled-document index](#), directly or through an indexed release record, and retrievable from its recorded release location. That record identifies the version/tag, source commit and relevant canon snapshot, package asset names, manifests, SHA-256 checksums, limitations, and supersession or historical status where applicable. GitHub's automatically generated source-code archive is not a substitute for a deliberately assembled controlled package.

Preserve published package identity and bytes. Corrections receive a new version and changelog; they do not silently replace an old ZIP under its existing name. Any later relocation must verify destination bytes against the recorded hash, update navigation, and retain provenance and disposition flags. A move is complete only after destination retrieval and checksum verification. This policy does not claim that such a migration has occurred or authorize bulk deletion of historical artifacts.

The [finance release process](#) continues to govern finance-specific builds, source locks, safety checks, and package manifests. Its published snapshots are not rewritten to incorporate a later canon decision. A successor release must record its own source scope and boundaries.

4. Existing package disposition and release index

This inventory records the two tracked ZIPs found in the September 6, 2026 closeout checkout and the existing published finance release. Local ZIP hashes and sizes were calculated from their bytes. Finance asset metadata was read from the GitHub release API on September 6, 2026; the API digest and release record are provenance for this inventory, not a claim of a new local download or revalidation of their internal manifests.

4.1 Brand archive: preserved, not distributable

- **Path:** assets/brand/packages/sable-harbor-logo-system-v0.1.0.zip
- **Version / size:** 0.1.0 / 2,635,913 bytes.
- **SHA-256:** 8c5d9c6c0de8163896a6ddc9c318f90a4927f5b2e54eba081c829aac20301ecd
- **Disposition:** explicit historical exception; retain the original in-tree bytes.
- **Existing controlling flags:** SUPERSEDED, HISTORICAL_SNAPSHOT, DO_NOT_DISTRIBUTE.
- **Source of flags:** [Brand package manifest](#).

The archive is effective through September 2 and was superseded September 5. It predates the approved Pale Sun/Red Wash raster-source overrides and contains noncurrent J2 stationery. The manifest records no current replacement. This policy neither removes those flags nor promotes the archive into a current release. A future distribution must be a separately built, reviewed, versioned package with the current approved assets.

4.2 Organization briefing: retained prior package

- **Path:** docs/organization/briefing/SABLE_HARBOR_Organization_Briefing_v1.0.zip
- **Version / size:** 1.0.0 / 1,437,035 bytes.
- **SHA-256:** 6a058ac51d686ef24987fa4a46e3299f79a2e22891569aa676621b6d88a84b6e

- **Disposition:** explicit historical placement exception; retain unchanged in-tree.
- **Source records:** [Briefing index](#) and [briefing manifest](#), canonical date August 31, 2026.

Keeping this previously delivered package preserves existing links and audit/training history without rewriting its bytes. Its source manifest supplies no separate distribution-state flag; this policy does not invent one or certify the package against later canon. Its exact ZIP hash is newly inventoried here because the briefing manifest inventories individual outputs rather than the enclosing ZIP. A future revised distributable version belongs in a GitHub Release. The old package is not silently regenerated in place.

4.3 Published finance release: retained at its release location

Release: [Sable Harbor finance v0.1.0](#)

Tag: `sable-harbor-finance-v0.1.0`

Published: September 5, 2026

Source commit: `4f837ebb229c68baa3655312726febb31cd0d2ba`

Pinned canon source: `712076751a31534cd9e6e41458336cdc7b6585b5`

Published asset	Bytes	Recorded SHA-256
Public demo ZIP	364,064	9eee33de25040a784abe82c12252011a98c129a94637268ba1fd8598f8cbbb8d
Business-unit evidence ZIP	216,637	ee2253e4ca340aa38f08bc6a1b9d4bd0b045ceccdb58139e6204be9f51e52f36
Package checksum inventory	231	0b252f7c54d724bd9cbc0ee790d03d770d571e7c998bf2b67d356eb70ba5e515

The release record identifies nested manifests/checksum inventories in both ZIPs. Preserve the release's PUBLIC_SAFE_SYNTHETIC classification, RETROSPECTIVE_CURRENT_CANON mode, canon effective through September 3, and September 5 preparation date. August 31 is its synthetic calibration boundary. It remains a published snapshot; this inventory does not assert that its modeled or OPEN facets became canon or that the seven evidence packages satisfy the broader unfinished audit-package requirements in issue #12.

4.4 Historical audit and future inventory changes

The [September 3 size audit](#) remains unchanged as a dated observation. Its possible future placement choices are superseded by this policy within this policy's scope. Its recorded repository size is not a current measurement. Existing convenience renders remain unless deliberately reviewed; no deletion or mass reclassification is implied. Record future package additions, replacements, or moves in the indexed release record with their actual evidence.

5. Thorough, organized documentation

Maintain one controlling source for each decision, with stable identifiers, dates, owners where applicable, explicit status, cross-references, and supersession links. Keep the README and controlled-document index navigable. Synchronize structured records, controlled PDFs, publication manifests, and derived catalogs to their controlling sources; distinguish a canonical structured input from a generated representation. Additional documentation should add evidence and traceability without creating competing current answers.

Preserve history with its original context. Current-facing summaries must point to the controlling resolution when an older record conflicts. Organization is part of delivery: an unindexed package or an undocumented dependency on a chat attachment is unfinished.

6. Explicit boundaries

- Issue #35's packaging decision can close after this policy and its disposition inventory are accepted and indexed.

The retained ZIPs satisfy its allowance for justified in-tree packages; their migration is not a prerequisite or a claimed accomplishment.

- Issue #37 remains OPEN for the specific generated-catalog/SQLite lifecycle. Current catalogs remain generated, non-authoritative representations under existing rules.
- Retention/deletion, collection access, and other unresolved institutional policies are not settled by a packaging location rule.
- Existing public/private and rights boundaries remain in force. Delivery to the appropriate controlled repository does not authorize publishing private evaluator material or widening access. Preserve the separation from SABLEHARBOR-ALEXANDRIA-CONTROL.
- Use the applicable [maintainer validation gates](#). Completion must cite actual results and accepted repository state rather than an anticipated successful build.
