

SABLE HARBOR — ADVISORY MATTER CONTROL STANDARD

Document ID: SH-ADV-CTRL-001

Version: 1.0.0

Effective: September 8, 2026

State: LOCKED DIRECTION

Control owner: Advisory President with Enterprise Risk/Controls

Related: SH-0BJ-ADV-001-003; SH-ADV-002; SH-ADV-ATL-DR-001

Purpose

This standard operationalizes the Advisory control objectives for an AI-native, outcome-priced professional-services business. It supplements the Common Control Framework; it does not replace enterprise Legal, Security, Finance, People, Records, Product or J2 controls.

Control objectives

ADV-ACC — Matter acceptance

Objective: Sable Harbor accepts only matters it can perform competently, lawfully, independently enough for the requested work, and within explicit authority.

Control	Requirement	Evidence
ADV-ACC-01	Acceptance Principal approves the matter before substantive delivery	signed/recorded matter acceptance
ADV-ACC-02	Client, counterparty, decision owner, scope and authority boundary are documented	Atlas matter header / contract
ADV-ACC-03	Conflicts and independence implications are dispositioned	conflict record
ADV-ACC-04	Competence and staffing plan are supportable	matter staffing rationale
ADV-ACC-05	Data rights, security and residency conditions are accepted before access	data/security acceptance
ADV-ACC-06	Purchased-conclusion risk is explicitly considered	acceptance assertion

ADV-VAL — Outcome economics

Objective: Variable fees are measured against an independently governed baseline and cannot be manipulated by the delivery team.

Control	Requirement	Evidence
ADV-VAL-01	Value Office approves baseline, metrics, attribution and payout curve before substantive work	value schedule
ADV-VAL-02	Baseline changes require independent disposition and version history	baseline change record

Control	Requirement	Evidence
ADV-VAL-03	Delivery team cannot self-certify variable payout	Value Office certification
ADV-VAL-04	Client dependencies and external exclusions are defined	signed measurement schedule
ADV-VAL-05	Final value calculation is reproducible from retained source data	calculation package / Atlas lineage

ADV-PRF — Professional quality

Objective: Consequential matters receive independent challenge without diffusing Matter Principal accountability.

Control	Requirement	Evidence
ADV-PRF-01	One Matter Principal is named	matter record
ADV-PRF-02	Independent Reviewer is appointed when risk criteria require	review assignment
ADV-PRF-03	Material contrary evidence and uncertainty are retained	evidence/model record
ADV-PRF-04	Professional conclusions identify accountable human authorship/adoption	signed/adopted work product
ADV-PRF-05	Client pressure to alter unsupported conclusions is escalated	issue/escalation record

ADV-AI — Agent and workflow governance

Objective: AI and agent systems increase professional capacity without obscuring provenance, authority or accountability.

Control	Requirement	Evidence
ADV-AI-01	Material agents/tools are versioned and attributable	Atlas agent registry
ADV-AI-02	Data and action scopes are bounded	entitlement/action policy
ADV-AI-03	Stop conditions and human owner are defined for consequential automations	workflow policy
ADV-AI-04	Material agent outputs adopted into professional conclusions are reviewable to source	provenance graph
ADV-AI-05	Client-transfer classification is defined for matter-specific agents/workflows	transfer classification

ADV-XFR — Capability transfer

Objective: A matter promising transfer leaves the client with an operable, governed capability without leaking protected Sable Harbor IP.

Control	Requirement	Evidence
ADV-XFR-01	Client owner is named before transfer acceptance	owner record
ADV-XFR-02	Client-owned, licensed and Sable Harbor-retained components are distinguished	transfer manifest
ADV-XFR-03	Transferred workflow/agent passes agreed tests	acceptance test record
ADV-XFR-04	Runbook, stop conditions, support and maintenance ownership are documented	operating package
ADV-XFR-05	Protected professional-plane and cross-client material are excluded	transfer scan/review

Control	Requirement	Evidence
ADV-XFR-06	Client can operate promised capability without undisclosed Sable Harbor dependency	acceptance demonstration

ADV-J2 — J2 firewall

Objective: Advisory cannot create a commercial incentive path that contaminates serving J2 personnel.

Control	Requirement	Evidence
ADV-J2-01	No serving J2 professional may enter an Advisory applicant pipeline	applicant control / audit
ADV-J2-02	No Advisory role or carry economics may be discussed with serving J2 personnel	attestation / investigation evidence if triggered
ADV-J2-03	Former J2 applicant records confirm qualifying service ended before application began	service-completion verification
ADV-J2-04	Carry eligibility uses the controlling service gate, not recruiter discretion	eligibility record
ADV-J2-05	Orientation anti-line-authority restrictions are checked before role approval	role-authority review

ADV-IP — Confidentiality and productization

Objective: Client work may inform generalized product development without unauthorized transfer of client IP, and client transfer may occur without disclosure of Sable Harbor crown-jewel material.

Control	Requirement	Evidence
ADV-IP-01	Contract establishes data, work-product and product-improvement rights	executed agreement
ADV-IP-02	Client-specific confidential content cannot silently enter generalized Atlas assets	productization review
ADV-IP-03	Sable Harbor operating-business trade secrets remain outside client transfer unless expressly authorized	transfer review
ADV-IP-04	J2 records and protected internal institutional material remain outside client workspaces	access/transfer controls

Matter risk triggers

Independent review and enhanced acceptance should be presumed for matters involving one or more of:

- physical safety or environmental consequence;
- regulated operations;
- material capital allocation;
- acquisition/disposition recommendation;
- outcome fee large enough to create a material incentive conflict;
- public-company or board-level decision use;
- highly sensitive personal, security or government information;
- autonomous or semi-autonomous action in a physical or production environment;
- novel agent capability without an established evaluation pattern;
- material reliance on evidence the client cannot independently inspect;

- cross-client model or IP contamination risk.

Control philosophy

The control system should make the dangerous thing difficult without turning every matter into a compliance ceremony. Evidence may live natively in Atlas Meridian rather than in duplicate forms where the platform can preserve the same control state more reliably.
