

Foundry Field — current business dossier

Document ID: SH-BIZ-FOUNDRY-FIELD-001

Version: 1.2.0

As of: September 9, 2026

State: CURRENT SOURCE SYNTHESIS

Owner: Foundry Field product and deployment leadership

Business and output

Sable Harbor's flagship deployable product, built on the Foundry substrate. Foundry preserves identity, meaning, provenance and authority in context; Foundry Field makes those foundations useful in operating work.

Deployable applications for operating, maintenance, reconciliation and exception workflows. Application names remain working descriptions where the source has not locked a commercial name. Product subscriptions, deployment acceptance and ongoing support are distinct obligations.

Operating lifecycle

Qualify customer and information rights → agree scope and acceptance → configure and validate → deploy under the customer's operating authority → support, renew, expand or retire. A successful demonstration does not authorize production.

Organization and authority

Priya carries product architecture, Elena deployment, Marcus technical architecture and Caleb field integration in the existing record. Nadia's remaining naming/title details stay open. These people are not automatically additional paid staff when they appear in several responsibility maps.

The customer and accountable operating owner retain operating decisions. Product administration, professional standards and deployment support do not create an alternative command chain.

Financial architecture

Named synthetic customer cohorts, contract terms, deployment dates, subscription obligations, renewals/churn, usage costs, support capacity and collections should drive the successor. Annual prepayment creates deferred revenue; deployment revenue requires acceptance. Customer concentration, recurring revenue, cost to serve and renewal timing must be visible separately from consolidated revenue.

Natural records and controls

Customer and contract master; order and performance obligations; deployment acceptance; support incidents and capacity; invoices, cash application, AR aging and deferred-revenue rollforward; configuration/change history.

Priority failure modes: Premature recognition before acceptance; a support promise exceeding capacity; cross-selling counted twice; restricted operational data copied into demonstrations; configuration drift.

The [local control and interface register](#) connects owner roles, evidence populations and existing CCF controls. Listed evidence requirements are not assertions that real controls operated.

Executable financial evidence

The [business-driven successor](#) now implements the current operating model and produces this unit's reconciled CSV, SQLite and audit workbook package. The [financial design](#) and [export contract](#) identify source events, preserved industrial references, scenario assumptions and remaining granularity. New Core economics begin in 2027; retained 2026 calibration remains explicit. Treasury schedules identify unfunded payment requests.

Operating histories and evidence

The [operating successor](#) adds won/lost/held pipeline decisions, dated contract amendments, shared deployment/support/incident capacity, service credits and renewal consequences. ARR and deferred-revenue bridges reconcile to the same financial journals; partial collections, disputes, write-offs and recoveries retain their invoice history.

Remaining boundaries

Exact commercial price cards, service commitments and unresolved personnel details are scenario inputs or open decisions. Industrial internal use must be identified separately from third-party sales.

Numerical successor assumptions remain publicly synthetic and separately versioned. Released v0.1 and industrial v2 evidence retains its original source boundary.
