

Cradle — current business dossier

Document ID: SH-BIZ-PROJECT-CRADLE-001

Version: 1.2.0

As of: September 9, 2026

State: CURRENT SOURCE SYNTHESIS

Owner: Cradle operating leadership and accountable host interfaces

Business and output

Cradle recovers useful material from designated side streams while preserving the host's primary operation. Its accepted architecture includes Stream 17 at Kelly Gang Mining, the Demotte mine-water intervention and the separate Bedford facility.

Stream 17 produces mixed rare-earth concentrate for specialist downstream sale. The equipment belongs to Cradle; rights and captured-material title follow the agreed recovery boundary. Demotte's controlled AMD slipstream is a learning and recovery intervention, not ownership of the host treatment plant.

Operating lifecycle

Authorize designated stream and stop/bypass conditions → measure feed and assay → recover and establish captured-material title → identify intermediate lots → receive/process at Bedford where applicable → downstream assay and acceptance → invoice → settle realized-value host share.

Organization and authority

Kelly Gang Mining and Demotte Reclamation Services are external hosts. Bedford is a fictional Fairmont-area development/refurbishment/analytical/upgrading site, not the Demotte treatment site or a mine. Host personnel are not Sable Harbor payroll.

Demotte owns ordinary treatment, compliance and stop authority; hard bypass always remains available. Cradle recovery authority does not supersede the host. No new uranium custody qualification is implied.

Financial architecture

Mineral tonnes × contained grade × availability × recovery is distinct from AMD water volume × dissolved concentration × recovery. Track fouling/downtime, reagents, energy, transport, assay, acceptance, payable product, costed unsold inventory, host share and payment timing. Gen-1 fouling and Gen-2 learning must affect operations. Do not backsolve selling price from an allocated enterprise revenue target.

Natural records and controls

Stream-rights scope; bypass/stop log; feed and assay; module run and maintenance; captured lot; Bedford batch and custody movement; downstream acceptance; sales invoice; host settlement; inventory rollforward and disposal.

Priority failure modes: Conflating water with mineral feed, treating all contained material as payable sale, unsupported product title, selling before assay/acceptance, missing host-share liabilities, and counting unsold intermediate as cash.

The [local control and interface register](#) connects owner roles, evidence populations and existing CCF controls. Listed evidence requirements are not assertions that real controls operated.

Executable financial evidence

The [business-driven successor](#) now implements the current operating model and produces this unit's reconciled CSV, SQLite and audit workbook package. The [financial design](#) and [export contract](#) identify source events, preserved industrial references, scenario assumptions and remaining granularity. New Core economics begin in 2027; retained 2026 calibration remains explicit. Treasury schedules identify unfunded payment requests.

Operating histories and evidence

The [operating successor](#) adds run assays, split/merge lot genealogy, mass and cost reconciliation, rejected/quarantined lots, custody evidence and downstream acceptance. Host settlements are limited by collected proceeds. Capture, sale, cash and physical permission remain separate events.

Remaining boundaries

The ten Cradle closeout decisions are settled. Exact prices, chemistry, tonnes, host-share percentages, product assays and commissioning ramps remain explicit synthetic scenarios, not remaining canon blockers.

Numerical successor assumptions remain publicly synthetic and separately versioned. Released v0.1 and industrial v2 evidence retains its original source boundary.
