

Runtime assurance scope and evidence dependencies

Document ID: SH-RT-ASSURANCE-001

Version: 1.0.0

Status: provisional scoping; operating effectiveness NOT_ASSERTED

Prepared / effective design date: 2026-09-11

Owner: Risk & Compliance with service owners and Finance

Authority: CCF and PR119 mandate

Structured companion: runtime source and security.assess_evidence

System and reporting boundary

The system includes customer-controlled equipment, platform software, identities, keys, data stores, recovery copies, operating people and procedures in the proposed Reno/Boise estate. Switch and IDACORE supply facility layers, not Sable Harbor's application controls or institutional judgment. Their subcontractors, carrier routes, CUECs and report carve-outs remain evidence dependencies. The owned site has no operating system boundary yet because it is preconstruction.

Alexandria is internal institutional use. Atlas and Foundry may create customer service commitments within their hosted scopes; customer-hosted/edge operation has different responsibility. No hosted contract or user-entity population is invented here. Scope a future report from actual services, commitments, contracts, period, customer dependencies, incidents and material changes.

[AICPA's SOC 1 topic](#) ties SOC 1 to controls relevant to user entities' internal control over financial reporting. Sable Harbor's own project accounting alone does not establish SOC 1 service relevance. Atlas/Foundry reporting or transaction dependencies require customer-specific assessment before claiming applicability.

For SOC 2, Security, Availability and Confidentiality are proposed categories based on this design's intended commitments. Processing Integrity and Privacy need a specific scoped commitment and processing inventory; all five categories are not automatically selected or satisfied. The [AICPA criteria resource](#) identifies the 2017 criteria with revised 2022 points of focus. Its full download requires account access in the inspected page. No paragraph-level validation or complete criterion crosswalk is claimed. The [SOC suite overview](#) describes CPA assurance services; this repository creates neither a report nor a certification. Type 1 design-at-a-date and Type 2 operation-over-a-period require distinct evidence propositions and professional scoping.

Provisional directional mapping

Native controls	Proposed category support	Scope limitation
SH-IAM-002/004/005/007, SH-SEC-001/002	Security	Customer access/configuration only; actual execution untested
SH-OPS-001/002, SH-BCM-001/002/003/004	Availability	Recovery requirements and design; no proven RTO/RPO
SH-DAT-001/002/003/005, SH-REC-004	Confidentiality	Rights/retention design; legal schedules and execution required

Native controls	Proposed category support	Scope limitation
SH-REC-002/003, SH-TPR-002/003/004	Supporting evidence	Not equivalent to practitioner requirements

Direction is Sable Harbor control to category, partial/contextual support, confidence low, review pending, non-equivalence true. Exact external requirement IDs remain unassigned until validated full text and practitioner review; technical practice or vendor labels do not become AICPA requirements.

Evidence collection and assessment

Expected evidence includes executed instruments and acceptance, metering and incident populations, complete access and change populations, backup job inventory, restore/failback results, provider reports, subservice/CUEC mapping and exceptions. For every extract retain authorized source, period, timezone, query/filters, pagination, transformations, expected/observed count, reconciliation, hash scope, preparer and independent reviewer. A hash proves acquired-byte integrity, not population completeness. Empty required populations fail or remain not run.

Assess control definition, implementation, design assessment, operating assessment and evidence origin independently. The current synthetic reference tests cannot be relabeled actual evidence or operating effectiveness. Targeted high-risk selections are not representative samples. Exceptions need owner, approver, expiry, compensating measures, remediation and original-period retest by a different reviewer; later unrelated PASS does not erase an original failure.

Provider reports require actual legal scope, service/site, period, auditor, opinion, exceptions, subservice treatment, CUECs and changes review. A provider bridge letter is an intervening management representation, not a new auditor opinion extending testing. Report bytes and restricted material remain outside this public package. Provider marketing assurance labels stay PUBLIC_CLAIM_ONLY.

Source-access register, retrieved September 11, 2026

Publisher / source	Valid use	Limitation / refresh owner
IDACORE pricing	Boise \$300/kW/month, actual-draw power-inclusive public baseline	Quote, meter and term ambiguity; Procurement
IDACORE Boise	Selected facility address and advertised facility characteristics	Reports, legal party and assigned space unverified; Security/Procurement
Switch Tahoe Reno	Selected campus identity	No customer reservation/contract; Procurement
NVIDIA DGX B300 guide	Distinguish system specifications from PSU sums	Different reference class from synthetic 8 kW model; Technology
AICPA SOC 1 topic, criteria resource and suite above	Engagement purpose and criteria identity	Full licensed/account-controlled authority and exact mappings unvalidated; Risk & Compliance
PostgreSQL version policy in architecture record	Supported release policy	Exact deployed BOM/patch acceptance unperformed; Platform

Public pages establish only their stated fields. Retrieval dates are not report periods or acceptance dates. No private NAILEX implementation, licensed text, hidden evaluator data, credentials, real attestation or real operating history is included in this design package.
