

ARU/BS&T interface and dependency record

Document ID: SH-PS-RW-LOG-001

Version: 1.1.0

Classification: PUBLIC_SYNTHETIC_DIEGETIC

Case available at: 2026-09-05T23:59:59-07:00

Source: red_wash/source/aru_bst_bridge.json and the industrial source registers

This successor retains the discovery evidence and implements the selected acquisition and ordinary industrial-input interface. The transportation dependency record ties service authority to the physical and financial model. Version 1.0 remains archived with its original open decisions. Corporate decisions, derived planning assumptions, synthetic operating evidence and actual external requirements are separate evidence states.

Discovery and acquisition chronology

Qualified external carriers handled every Red Wash movement in 2025. ARU and BS&T were not Northstar vendors or historical Red Wash carriers. The Q3 2025 fictional carrier consolidation and Q4 lane-allocation constraint expose a scheduling problem; all annual Red Wash sales and revenue are preserved. The carrier search broadens into operating geography and asks whose railway can support durable logistics.

ARU is surfaced in Q4 2025. Acquisition diligence, financing and negotiation occur before the January 7, 2026 close. The first 90 days after closing are confirmatory condition work and urgent stewardship, not a substitute for pre-close diligence. Fred Tolman leads the seller group and has no post-close operating authority. Northstar Minerals, Inc. and Henry Norwood belong to the separate Red Wash deal.

American Resource Utility, Inc. remains independently viable as an acquired group. Blood, Sweat & Tears Railway Company is its wholly owned railway subsidiary. Both are Wyoming corporations; their regulatory and operating identities survive the stock acquisition. The industrial holding company is the corporate buyer.

Physical operating boundary

Taylor is the fictional yard, shop and transload hub. Wamsutter supplies real-reference Union Pacific interchange context. The selected BS&T network is approximately 40 total route-miles, comprising the main line and historic branches. It is not a 40-mile mine spur. A modeled truck road completes the mine last mile. Geospatial sources identify real reference features separately from synthetic route vertices, structures, industrial access and facility boundaries.

The mine anchor is 42.2200 N, 108.1800 W in Sweetwater County. Its new geographic setting requires independent terrain, road, elevation and coordinate treatment; legacy Carbon County maps remain superseded originals. Approximately 6,885 feet is a sampled screening elevation, not a survey or construction design.

Taylor has two ten-car general transload tracks, a six-car liquid track, hardstand, warehouse interface, transfer controls and truck staging. Red Wash has receiving, acid and binder inventory, laydown, scales and custody systems. The site has no mine rail spur. Ordinary-input commissioning does not qualify uranium-product custody.

Demand, storage and service

The annual planning allowance is 225 inbound car equivalents: 205 base commodity cars, ten project cars and ten

conditional buffer cars. The 300-car figure is design capacity. Neither buffer nor unused capacity creates an invoice or a volume promise. The commodity register separates acid, binder, lime, steel, MRO and projects; aggregate is locally sourced and fuel begins truck-delivered. Product concentrate is excluded.

The operating model translates payload and commodity consumption into tonnage, truck trips, usable storage, replenishment batches and the 10–14-day critical-stock requirement. Capacity and buffer assumptions are explicitly synthetic engineering inputs. They are not manufacturer certificates or evidence of licensed operation.

Tuesday and Friday are scheduled handling windows, within the five-day railway service. Dispatch exception moves protect the elapsed-hour SLA for off-window arrivals; a 96-hour Friday-to-Tuesday gap cannot be disguised as 72 business hours. The ordinary-input default is 72 hours from interchange receipt to empty release, with a 36–48-hour operating goal and a 96-hour steel maximum. The calendar model measures arrivals, handling, release and exception costs. Acid/binder service targets 95% on time. Cause-based demurrage and each custodian's timestamp remain explicit.

Selected limited ordinary-input service starts July 7, 2026. A partial startup year is not a full normalized year. September–December plans remain forecasts as of the September 5 cutoff; future maturity review and expansion are not completed events.

Capital ownership and cash

Component	Selected amount	Treatment
Red Wash receiving and storage	\$3,250,000	Mine-owned Phase 1 assets
Reusable Taylor infrastructure	\$5,250,000	ARU-owned multi-customer Phase 1 assets
Approved Phase 1 total	\$8,500,000	Funded and timed once in the industrial ledger
Unapproved expansion residual	\$6,500,000	Future gate, not expenditure
Interface maximum ceiling	\$15,000,000	Ceiling, not an additional ledger line

The \$11 million ARU catch-up program and \$3.3 million annual sustaining capital are separate from this interface. The original mine's \$4 million sustaining and \$5 million rehabilitation budgets do not conceal its new \$3.25 million interface investment. The successor funding schedule distinguishes operating cash, parent equity, debt, fees, capital and working capital. Equity contributions are financing, never revenue.

Commercial and custody controls

The five-year agreement uses separately identified railway, terminal and trucking charges, annual indexing/review and cost-to-serve support. The final selected rate card follows the model's costs and benchmark limitations; the earlier \$875,000 revenue and \$365,000 incremental EBITDA figures are comparison anchors, not required plugs. External Class I linehaul is distinguished from ARU revenue. No service price is represented as an actual tariff quote or third-party bid.

There is no minimum-volume guarantee, hidden operating subsidy, automatic preference or prohibition on outside carriers. Red Wash and ARU keep separate P&Ls; invoices, receivables/payables and intercompany expense/revenue eliminate at the industrial consolidation boundary. Capital allocation remains visible rather than being hidden inside railway pricing. Customer return and multi-customer investment justify the Taylor asset case; Red Wash does not retrospectively justify the entire acquisition.

Direct uranium custody remains OPEN_GATED. The gate register assigns material, packaging, route, custody, training, emergency-response, insurance, commercial and customer requirements to their actual responsible parties. A blanket invented NRC carrier license is not a substitute for that role analysis. Qualified external carriers remain permanently permissible. Government permits, license replicas and regulatory approvals are not fabricated by this record.

Current evidence navigation

- [Operating source](#): capacities, facilities, equipment, represented crafts, safety history, rates and the modeled SLA calendar.
- [Finance source](#): acquisition and operating schedules, capital timing, invoice elimination and funding.
- [Corporate sources](#): ownership and authority.
- [Industrial case](#): controlled documents, generated evidence, maps, build instructions and participant-edition manifest.

Only direct uranium custody, a future mine spur and expansion commissioning dates remain future operating decisions in this bridge. Historical discovery gaps remain visible with their original timing; they do not reopen implemented ordinary-input facilities or the acquired company's selected financial baseline.
