

Decision Register Addendum - Canon Closeout Decisions

Document ID: SH-CANON-CLOSEOUT-20260906-001

Version: 1.0.0

Decision date: September 6, 2026

Owner: Repository owner

State: LOCKED decisions; expressly reserved implementation remains OPEN

Decision authority: Repository owner's explicit approvals in the canon-closeout conversation

Repository promotion: Controlling when PR #97 is accepted into main; branch copies alone are not canonical promotion

Structured companion: [Closeout decision record](#)

Status and authority

The owner explicitly approved the decisions below. Their approval is preserved here so the record does not depend on access to a conversation or attachment. The accepted repository record is the source of truth. Approval, repository integration, canonical promotion, publication, and issue closure are distinct events. PR #97 supplies the integration history; the [validation record](#) supplies execution evidence. A draft branch, generated PDF, checksum, or passing test alone does not create approval.

Once reconciled and accepted into the repository's controlling canon, this dated addendum supersedes conflicting earlier statements within its exact scope. Unrelated OPEN matters remain open. Historical board records, original design-session ledgers, released financial snapshots, and prior artifact bytes retain their original dates and provenance. This editorial record does not invent a new in-universe board meeting or backdate these approvals.

CLOSE-001 - Daniel Mercer

Canon state: LOCKED

The founder and chief executive's full name is **Daniel Mercer**. This preserves the name already used in the founding narrative and decision BR-002. Current-facing statements that his surname was not supplied are superseded by this decision.

This naming decision does not establish any family relationship with Evan Mercer. It does not change either person's identity, role, board membership, or history, and it does not resolve other characters' surnames by implication.

The current [board doctrine v1.0.1](#), structured director record, and finance collision COL-013 agree with this name. This addendum supersedes conflicting current-governance statements in the earlier corporate lore and decision register within this scope. The collision retains its prior statements and dated resolution. The finance-pinned corporate lore v0.3, original decision register, and board doctrine v1.0.0 retain their exact source bytes; they are historical baselines, not competing current answers. Existing finance source locks and released packages retain their original snapshots; they must not be silently rewritten.

CLOSE-002 - Semaphore precedence

Canon state: LOCKED vocabulary; runtime implementation remains separate

Issue: #23

Level	Agreed handling meaning
Routine	Handle through the normal reading and response cycle.
Priority	Expedite; waiting for the normal cycle could materially impair a decision.
Immediate	Interrupt normal work for prompt attention; an active situation needs a timely response.
Flash	Exceptional, time-critical traffic where delay could cause severe, imminent consequences.

Precedence conveys handling urgency only. It does not confer truth, confidence, enduring importance, author seniority, or authority to command. A Routine message can be strategically profound; a Flash message can contain uncertain information. Foundational doctrine makes no fixed response-time promise. Operational procedures may define justified handling targets without changing those meanings.

Semaphore remains durable, searchable, threaded, supersession-aware, and human-authored. Orientation Officers retain professional judgment over what merits traffic. Adoption does not rewrite the metadata or vocabulary of historical cables.

CLOSE-003 - Planned Alexandria AR and VR integration

Canon state: LOCKED ARCHITECTURAL DIRECTION; delivery details OPEN

Issue: #25

Alexandria must be fully usable through an ordinary desktop interface. Future augmented reality **and virtual reality** integration is planned, not merely an unspecified possibility. The architecture should support those future interfaces without making headsets or spatial hardware prerequisites for core use.

Spatial interaction serves understanding of relationships, chronology, physical locations, evidence lineage, and competing interpretations. It does not create another institution or change Alexandria's authority. Access, disclosure, provenance, uncertainty, and human-authorship rules apply through every interface; visual prominence cannot imply truth or consensus, and relationships cannot be exposed to unauthorized viewers.

No current AR/VR implementation, device, vendor, delivery date, or procurement commitment is asserted. Detailed interface and runtime work remains open. Daedalus synthetic workspace content remains non-authoritative and cannot automatically enter institutional records.

CLOSE-004 - Repository delivery and packaging

Canon state: LOCKED repository policy

Issue: #35; #37's specific catalog/SQLite lifecycle remains a separate unresolved decision

Material	Agreed location and treatment
Canonical documents, code, schemas, configuration, generators	Versioned in the repository.
Approved source artwork and canonical visual references	Versioned in the repository with provenance.
Controlled corporate PDFs and publications	In the repository alongside their source lineage.
Complete distributable ZIP packages	GitHub Releases, with version identifiers, manifests, and checksums; linked from the repository index.
Temporary previews, intermediate renders, build debris	Excluded unless deliberately preserved as evidence.

Nothing is considered delivered or closed merely because it exists in a conversation, attachment, local scratch directory, or an assistant's completion statement. Chat approval authorizes the change; repository integration and canonical acceptance make the controlled record the source of truth. A branch or PR must be identified honestly as

pending while it has not been accepted into controlling canon. A checksum alone is not delivery of the bytes.

Every controlled release package must be discoverable from the repository and retrievable from its recorded release location. Existing historical packages are preserved or deliberately migrated with identity and checksums intact. This policy does not authorize bulk deletion, reclassification of a quarantined archive as current, or rewriting prior release bytes.

Document thoroughly and keep the archive organized: maintain one controlling source per decision, stable identifiers, explicit owners/status/dates where applicable, clear indexes, cross-references, supersession links, and synchronized structured/publication representations. Additional documentation must add traceability rather than create competing sources of truth. The existing public/private boundary is unchanged; private evaluator material is not made public by a repository-delivery requirement.

Repository implementation and historical checkpoint

Base reviewed: 8d20e51a7cf0068729e3296840ccb5ba1ac1d7bd

The initial source-only checkpoint was preserved in commit 26644c3bb51625fde8e5f866cb561cf729f3357e. It accurately recorded the then-missing qpdf dependency and denied package-installation attempt. The owner subsequently authorized a narrow publication-builder compatibility update, reconciliation, validation, and merge. That permission does not grant new in-world authority to an AI or change Daedalus doctrine.

The compatible build keeps office rendering and Ghostscript page sizing, adds an explicit pypdf normalization backend, and records the selected backend on newly built publications. It does not promise byte identity across different toolchains. Historical PDFs and package bytes are retained with their original identity; the current manifest identifies replacements.

The [delivery policy](#) records the repository-wide artifact disposition, including named historical ZIP exceptions and the existing finance release. The [validation record](#) records checks actually executed, limitations, and the publication/merge evidence. GitHub issue state records actual closure: #23 and #25 cover these decision scopes, and #35 covers the adopted packaging policy and documented disposition. AR/VR runtime completion is not claimed by closing its architectural-direction issue.

Issues #11, #12, #18, #19, #21, #22, #24, #33, #34, #37, #38, #44, and #88 are not resolved by this addendum. No claim is made that the separate geospatial or ARU draft PRs have been integrated.
