

Company edition 1.2.0 — inspection route

Document ID: SH-COMPANY-INSPECTION-20260922-V12

Status: Prepared for review; source acceptance, final validation, packaging and publication pending. The final release receipt must identify the accepted merge, adopted source register, dependency pins, actual package hashes and cutoff. This guide does not itself accept or publish an edition. Editions 1.0.0 and 1.1.0 retain their bytes and historical claims.

Declared company scope

The edition combines August 2026 completed operating populations, separately dated September operating events, September 22 corporate/people/legal successors and labeled conditional forecasts. These are separate periods and evidence states. Newly authored historical records become knowable only at their actual source availability; effective dates do not backdate publication.

The [original inspection route](#) retains the financial/tax, seven-business-line and corporate traces. The [v1.1 route](#) retains the administrative and rights populations. This successor completes the ten current J2 personnel profiles, including four missing personal names, while preserving six accepted leaders, 237 authorized billets, 181 occupied J2 positions and 18 Orientation commissions. The 702-person export is the **August completed census**, not a claim of 702 active September employees. Stable IDs preserve the September exit/access events. No broad names/history residual remains for this bounded issue #19 population; biographies for every authorized billet are not an added requirement.

The [final import contract](#) covers the exact new table populations. The original 98 tables and eleven successor tables remain intact. Administrative rows do not create additional people, wages, journal entries, equity, cash or access grants.

Reviewer routes

Reviewer	Records and required checks
Financial/tax	Reperform the legal-book and consolidated bridges, tax history/provisions, exactly \$30 million noncash Core goodwill removal and distinct ARU acquisition goodwill. Reconcile capital contributions and source settlement to the same frozen journal and sovereignty outputs. Use final validation receipts, not historical test results, for the release revision.
Capital/credit	Join holder IDs to the five-holder register and designation schedules. Review the original 64-asset grant beside the later asset/site/filing, search and two payoff-release records. Preserve the original unsubmitted/unreleased state as history; later synthetic acknowledgement/release requires its own effective and available time. Search scope and priority qualifications remain explicit; payoff alone never proves release.
Commercial/regulatory	Join host instruments to site IDs; prospective October framework eligibility and zero accepted work orders do not establish active services. Inspect the sponsored Advisory plan's zero-participant/zero-issued-unit state and excluded equity/control rights. Follow permit, obligation, qualification, tax and adverse-event evidence to applicable source versions.
People/IT	Join ten profiles to existing person/position IDs and the office/commission histories. Inspect qualification evidence, retained nonselection, terms and expiry. Reconcile the complete August census to payroll and September event changes. Policy subjects are a census, not grants. Inspect seven record classes, restriction ownership, challenge/review, hold/disposal and disclosure decisions.

Reviewer	Records and required checks
Agentic evaluator	Import the existing CSV/SQLite packages; verify declared schema, populations, hashes, source commit and both effective/known-on boundaries. Reconstruct joins by stable IDs, retain empty populations and distinguish nested administrative evidence from monetary postings.

Bounded runtime and restore evidence

The [September 22 runtime receipt](#) documents a local working-copy environment using native disposal at portal commit 5344bf76413ffe2cd378b957dbb5f7d56d04ea19. The exercised backup predates disposal: current independently retained disposal/grant state suppresses two deleted copies, keeps a held copy undisclosed and denies revoked access after restore. Twenty-seven positive/negative results cover that declared population. Missing/stale checkpoints, pending operations, changed bytes/populations and concurrent state changes fail closed.

The policy and adapter exercise read, search/snippet, citation, count, graph, tool/answer context, export and personal-memory boundaries. Limited metadata/count access does not grant source bytes. No vector index exists in this environment; vector requests disclose no payload. These are deterministic software checks, distinct from model-specific inference evaluation.

The exact native dependency was local-only and is now preserved in the [controlled runtime release](#). [Dependency identity](#) records its exact commit, archive hash and access boundary. Authorized runtime inspectors require private repository access; the public company CSV/SQLite edition remains independently importable. Fresh extraction passed Git integrity and the 27-result native working-copy rehearsal. Public company evidence excludes private databases, evaluator rules, hidden answers and live server state.

This is a trusted local operator boundary with authenticated policy context supplied by its caller. It is not a deployed Internet service, deletion of immutable CompanyStore originals, secure erasure, proof of every external estate readiness gate or a model-specific safety evaluation. Active portal work remains independently owned.

Reproduction and acceptance

Use the exact accepted source and dependency pins in the release receipt, with `uv sync --frozen --all-extras`. The existing finance/completed-period/custody generators and shared CSV/SQLite writer remain the publication path. Run the final-record and legal-provider tests, source locks, full maintainer checks, clean independent import and composite reperformance. Exact successful commands, artifacts and totals must be recorded for the accepted revision; an earlier branch run is not release acceptance.

For the native working-copy exercise use `python -m tools.company_closeout.working_copy_rehearsal` with the pinned isolated portal checkout, the receipt-identified public edition ZIP and its actual SHA-256, and a new private output directory. Never run against active services or publish private working databases. The existing receipt's v1.1 package is historical exercised evidence; any v1.2 package rehearsal needs a separately recorded invocation and result.

Remaining boundaries

Issue #88 concerns recovery of one approved exact HQ image: the expanded 65,279-raster search found no matching bytes. A lookalike is not recovery. Issues #107/#108 retain their specific engineering/historical-precision work; all 78,145 original geographic carriers were dispositioned under PR164, so the old 8,961-carrier backlog is stale. See the [current criterion matrix](#). This edition does not claim new surveys, title, construction or unrestricted future rail alignments.

Synthetic signatures, agency receipts, searches and settlements remain authored company evidence, not real external execution or independent third-party confirmation. External deployment and those artifact/engineering claims remain separately bounded. Adverse economics, unpaid obligations, failed controls and future-due duties remain visible; acceptance is neither an audit opinion nor a guarantee of sovereignty.
