

Company edition 1.1.0 — inspection route

Document ID: SH-COMPANY-INSPECTION-20260922

Version: 1.1.0

Status: Delivery contract pending actual accepted-source release. The [versioned adoption register](#) controls this successor’s precise scope. Actual acceptance, source commit, publication and package hashes belong to the indexed Release receipt. Edition 1.0.0 retains its exact bytes and historical scope.

What changes

The owner approved the half-original-unit investor designation schedule, an ARU-owned collateral schedule with the reviewed debt terms, and prospective Cradle host option B with its common terms. Each decision has its own dated canon source and explicitly authored fictional execution records. Ten current-office administrative histories and all 18 occupied Orientation positions’ admissions and standard commissions are also completed.

These records add **260 rows across 11 explicitly scoped tables** to the existing enterprise CSV/SQLite exports. They do not add people, units, cash, journal postings or guaranteed revenue. The [import contract](#) defines populations, source hashes, joins, known-on and effective-date queries, and the empty prospective work-order population.

Periods and knowledge

The operating package remains the August 2026 completed month plus separately dated operating events through September 14, America/Los_Angeles. Newly authored historical qualification records retain their earlier fictional effective dates and later actual source availability. The corporate rights successors are effective September 22 within their declared scope; host framework eligibility begins October 1, with no accepted work orders or active access inferred. Conditional forecasts retain their scenario and period labels. Do not treat these different populations as one September actual ledger.

Inspection paths

Reviewer	Start and reperform
Financial/tax	Use the original financial route for tax, the exactly \$30M noncash Core goodwill correction, protected ARU acquisition bridges and sovereignty. Compare edition receipts for common-source journal/statement/export totals; the rights/history additions make no monetary posting.
Capital/credit	Read designation rights and ARU secured terms . Join two schedules/five assents to the existing holders; inspect all 64 collateral records, seven context-only facilities and 78 exclusions. Filing, perfection, priority and old-lien release states remain distinct.
Commercial/regulatory	Read Cradle host terms and the two separate instruments. Zero accepted orders does not authorize deployment, a sale or a permanent participation rate. Existing permit/event populations and adverse findings remain in the original inspection route.
People/IT	Join ten office histories and 18 commissions to the accepted 702-person workforce using stable IDs. Check expiry, the retained nonselection and role restrictions. Use pinned portal evidence for the exact exercised software scope.
Agentic evaluator	Independently import all enterprise/per-unit CSV and SQLite populations, compare schema, rows, hashes and journals, then apply both effective and known-on boundaries to successor records. Nested payload references are provenance, not additional monetary postings.

Reproduction

Use a clean checkout at the receipt's exact accepted source and `uv sync --frozen --all-extras`. Run the existing `python -m enterprise.closeout.build`, `python -m enterprise.operations.completed_period` and `python -m enterprise.operations.september_custody` builders. The closeout export builder consumes the explicit schema/scope extension through the existing shared CSV/SQLite writer.

Run `python -m tools.company_closeout.independent_import enterprise/generated/company-closeout-v1/exports` plus the financial and completed-period reperformance commands documented in the original guide. Compose/package with the existing company-edition tools using version 1.1.0, the actual successor PR, and adoption path `docs/internal/company-closeout/REGISTER_v1.1.0.json`. An unmerged checkout cannot produce an accepted edition. Exact CLI invocations and results are retained in Release validation evidence.

Limits that survive acceptance

This is synthetic evidence, not real signatures, registrations, filings, bank confirmation or an audit opinion. No perfection, first-priority collateral claim or old-lien release is fabricated. Historical side-letter absence and earlier host endpoints are not asserted. The future reporting/commission-transition duties remain due work. Failed controls, unpaid taxes and adverse economics remain visible.

The active portal owns its runtime implementation. Pinned isolated tests, public-copy disposal and software restore evidence do not establish all native lifecycle/indirect-disclosure behavior or external deployment. Exact-image recovery, wider engineering and broader names/biographies remain separately bounded. Acceptance of this edition's declared records does not silently close those claims.
