

ALEXANDRIA INSTITUTIONAL CATALOG — QUERY GUIDE

Document ID: SH-ALX-CATALOG-GUIDE-001 | **Version:** 1.0.0 | **Effective:** September 2, 2026 | **State:** CONTROLLED

Owner: Orientation | **Related:** Pinakes, Alexandria, controlled-document system | **Cross-reference:** institutional_catalog.json; institutional_catalog.sqlite3; ../CONTROLLED_DOCUMENT_INDEX.md

Purpose and authority

The institutional catalog makes Sable Harbor doctrine discoverable without becoming another source of truth. Canonical Markdown governs content. The controlled-publication manifest binds each source to its publication checksum. The JSON catalog and SQLite database are generated views of those records and can always be rebuilt.

The database contains `institutional_object`, `relationship`, `institutional_search`, and `current_institutional_object`. Each object has a stable document ID, title, category, owner, version, state, canonical source, controlled publication, and both checksums. Relationships expose related doctrines and cross-references. Full-text search supports discovery across titles and source content.

Representative queries

Employee navigation contract

Pinakes is the human front door. Search results must take the employee to the canonical source, controlled publication, structured record, and available lineage. Access controls may restrict evidence, but they should preserve the visible question and the existence of relevant restricted material where lawful. A broken source, publication, checksum, relationship, or search record is a controlled-document defect.
